

Kozy Care

The complete handover for the Kozy Care platform and brand: what you own, how to run the business day-to-day, and the technical guide for whoever develops it next. Live booking site, admin console, driver app, print kit and business cards included.

Prepared for the Kozy Care team

Lagos, Nigeria · August 2026

PART I — GUIDE FOR THE CLIENT

Everything you need to run Kozy Care day-to-day, no developer required.

1. Executive Summary

Kozy Care is live. Your customers can book a pickup in about two minutes at <https://kozycare.ng> — with or without an account — pay by bank transfer or card, track their order in a personal portal, and leave a review that flows straight into your admin console. Your team manages the whole business from one admin dashboard: orders, payment verification, customer records, pricing, and reviews. Riders run pickups and deliveries from a mobile-optimised driver app with GPS geofencing across twelve Lagos service zones. Alongside the software, you now own a complete brand and print kit: a production logo system, A5 flyers, an A3 poster, and business cards in two colourways, all print-ready with crop marks and bleed.

This document is written for two readers. **Part I** is for you, the business owner: what you own, how to access it, how to run daily operations, and a short list of actions only you can take (security, payment keys, and a few account settings). **Part II** is for whoever develops the platform next: architecture, the deployment pipeline, environment variables, subsystem documentation, known limitations, and a prioritised roadmap. Keep this document with your business records — it is the single source of truth for the handover.

Two things to internalise immediately. First, the platform is fully functional today, but three revenue-relevant integrations — online card payment (Paystack), SMS notifications (Termii), and the verified email sender (Brevo) — are built and waiting for API keys that only you can provide. Second, several credentials were shared over chat during development; rotating them is the single most urgent security action on your list, and it takes about ten minutes.

2. What You Own — Platforms & Live Assets

The table below is the complete inventory of what this project has delivered. Everything in it is yours: the code is in your GitHub account, the hosting and database run on your Vercel and Supabase accounts, the domain is registered to you, and every design file ships with editable sources. Nothing is locked to a third party or to the original developer.

Asset	Where it lives	What it does
Customer website	https://kozycare.ng	Landing page, pricing, testimonials, booking
Guest booking flow	https://kozycare.ng/book	Book a pickup without creating an account
Customer portal	https://kozycare.ng/portal	Order tracking, invoices, reviews
Admin console	https://kozycare.ng/admin	Orders, payments, CRM, pricing, reviews, finance

Asset	Where it lives	What it does
Driver app	https://kozycare.ng/driver	Route view with GPS geofencing and swipe confirmations
Rider recruitment	https://kozycare.ng/join-riders	Public application page for new riders
Source code	github.com/R2deetwo/Kozy-Dryclean	The entire application (public repository)
Brand & print kit	kozy-brand folder (delivered with this handover)	Logo system, flyers, poster, business cards, brand sheet
Domain	kozycare.ng (your registrar)	Points to Vercel; www redirects to the apex domain

Table 1 — Inventory of live assets and where each one lives.

The website is fully responsive and has been verified end-to-end on production: a real guest order was placed, priced from the live catalogue, and tracked through the payment-verification queue. Search engine basics are in place — sitemap.xml, robots.txt, canonical URLs, and a branded social-share image — so Google can index the site and WhatsApp link previews show the Kozy card. Vercel Analytics is installed but needs one click from you to start collecting traffic data (see action item 5).

3. Accounts, Access & Security

Seven online accounts together run the whole operation. You should be the owner of record on all of them, with the login credentials stored in your password manager. The table lists each account, what it does, and what to check on day one.

Account	Purpose	Day-one check
GitHub (R2deetwo)	Source code repository	Confirm you can sign in and see the Kozy-Dryclean repo
Vercel	Hosting & deploys (project: kozy-dryclean)	Confirm the kozycare.ng domain shows as valid in Settings → Domains
Supabase	Postgres database (all business data)	Confirm sign-in; the database is managed, no daily work needed
Upstash	Redis for rate limiting	Confirm sign-in; no daily work needed
Brevo	Transactional email (receipts, resets, updates)	Verify concierge@kozy.ng as a sender (action item 2)
Paystack	Online card payments	Add API keys in Vercel (action item 3)
Termii	SMS notifications	Add API key in Vercel (action item 4)

Account	Purpose	Day-one check
Domain registrar	kozycare.ng DNS	Records already point to Vercel — no change needed

Table 2 — The accounts that run Kozy Care and what to verify on each.

3.1 Security — read this first

During development, a GitHub personal access token and a Vercel token were shared over chat to push code and trigger deployments. Chat history is not a secure place for credentials. Both tokens work as of handover day and must be treated as potentially exposed. Rotating them takes minutes and locks the window permanently: generate new tokens, update the Vercel token anywhere you use it, and revoke the old ones. Until this is done, anyone with the chat history could push code to your repository or trigger deployments. This is action item 1 for a reason.

Going forward, treat secrets with three simple habits. Never paste tokens into chat or email; share them through a password manager or a secure note that expires. Never commit secrets to the repository — GitHub push protection is enabled and has already blocked accidental leaks twice, but it is a safety net, not a strategy. Finally, all runtime secrets belong in the Vercel environment-variable settings (or the .env file on your own machine), never in the code itself.

4. Running the Business Day-to-Day

Everything below happens inside the admin console at kozycare.ng/admin and needs no developer. Sign in with your admin account; the console is organised into views reachable from the sidebar.

4.1 Orders — the daily rhythm

New bookings appear in the orders view, which you can flip between a Kanban board and a list. A typical day: open the console in the morning and look for orders sitting in PAYMENT PENDING VERIFICATION (these are bank-transfer customers who have paid and are waiting for you to confirm their transfer in the payment queue). Once verified, the order moves along the pipeline (picked up → cleaning → out for delivery → delivered) either automatically as riders confirm stops in the driver app, or manually from the order modal. Every status change can trigger a customer email automatically, so the customer stays informed without you lifting a finger.

4.2 Money — verification, refunds, and finance

The payment queue shows every pending transfer with the order number and amount; match it against your bank statement and approve. Card payments (once Paystack is activated) verify themselves through a webhook and need no manual step. The finance view charts revenue over time, and invoices are generated per order and available to the customer in their portal. Refund handling follows your published refund policy

(the /refunds page is live) — refunds for card payments are initiated from your Paystack dashboard, and bank-transfer refunds are a manual transfer from your bank.

4.3 Customers, reviews, and pricing

The CRM view lists every customer with their order history. Reviews arrive from two places: the Rate button customers see on delivered orders in their portal, and the public review form. New reviews wait in the reviews view for your approval before they appear in the landing-page carousel — nothing goes public without you. Pricing lives in the settings view: change any item price and the landing page, booking wizard, and future invoices all pick it up, because they all read from the same server-side catalogue. This is also where your bank-account details for transfer payments are maintained.

The one-minute price check

Prices on the printed flyer were synced with the website on 28 August 2026 (including Sneakers White ₦1,500 / Coloured ₦1,000 and sneaker restoration from ₦5,000). If you change prices in settings later, the website updates instantly — the flyer does not. Reprint flyers only after a big price change, or ask a developer to regenerate the artwork in minutes from the editable sources.

5. Your Action Items

Nine items, in priority order. Items 1–5 are quick account settings; items 6–9 are business decisions. None require a developer, though a developer can help with 3 and 4 if you prefer.

#	Action	Where / how
1	Rotate the GitHub and Vercel tokens (shared over chat during development)	GitHub → Settings → Developer settings → Tokens; Vercel → Settings → Tokens. Revoke old, create new
2	Verify concierge@kozy.ng as an email sender	Brevo → Senders & IP → add and verify the domain/address
3	Activate online card payment	Paystack dashboard → Settings → API Keys → add Secret Key + Webhook Secret in Vercel env vars
4	Activate SMS notifications	Termii dashboard → copy API key into Vercel env var TERMII_API_KEY
5	Enable web analytics	Vercel project → Analytics tab → click Enable (script is already installed)
6	Honour the printed offers	15% off first order; free pickup & delivery applies to the first order only
7	Personalise the business cards (optional)	Add a name/title via the editable HTML sources in the kit

#	Action	Where / how
8	Decide on a brand-sheet refresh (optional)	Current sheet documents the previous logo generation; colours and type rules still apply
9	Cancel the test order KZ-02150959	Admin console → orders → the order labelled "E2E Test (safe to cancel)"

Table 3 — Client to-do list, priority order. Items 1–5 unlock existing features.

Why items 3 and 4 matter most commercially: the online payment flow is fully built — customers choose "Pay Online — Card", get redirected to Paystack, and the payment confirms itself via webhook — but until the keys are set the button politely explains online payment is not configured and offers bank transfer instead. Every day the keys are missing is a day some customers abandon the transfer hassle. SMS works the same way: pickup and delivery alerts are written and wired, silent until the Termii key arrives.

6. Marketing & Print Kit

The kozy-brand folder delivered with this handover contains the complete, print-ready marketing kit. Every piece exists in three forms: a print PDF with crop marks, bleed, and CMYK colour conversion for the press; a digital PDF without marks for WhatsApp, Instagram, and email; and an editable HTML source so any text change is a one-line edit followed by a re-render. The QR codes on every piece point to <https://kozycare.ng> and were decoded and verified before delivery.

Piece	Spec	Contents
Services flyer (A5, double-sided)	148 × 210 mm + 3 mm bleed	Brand front; full price list back (19 items, live prices)
Offer flyer (A5, single-sided)	148 × 210 mm + 3 mm bleed	15% off first order; value chips; QR
Poster (A3)	297 × 420 mm + 3 mm bleed	"Three steps. Zero fuss." with offer band
Business cards (85 × 55 mm)	Navy and white colourways, 2-sided	Brand front; phone, email, web, QR, both addresses back
Logo system	SVG vectors + PNGs to 3824 px	Three lockups × three colourways + favicons + print PDF
Brand sheet (A4)	210 × 297 mm	Colour codes (HEX/RGB/CMYK + Pantone 871 C note), typography, usage rules

Table 4 — The marketing kit at a glance.

Three claims appear on the printed pieces and are part of your offer terms: **15% off the first order**, and **free pickup and delivery for the first order only** (marked with an asterisk and fine print on every piece that claims it). The turnaround language reads "express from 24 hours — regular service is 3–5 days", which matches how the service actually runs; the earlier "48-hour" wording was removed from all pieces. Both

addresses — Ogombo and Paradise 3 Estate, Chevron — appear on every piece. When you hand files to a printer, give them only the PDFs inside each print/ folder; the kit README (README-PRINT.txt) contains the exact paper and finishing recommendations to pass on.

PART II — GUIDE FOR THE DEVELOPER

Architecture, deployment, subsystems, and technical debt for whoever works on this next.

7. Architecture Overview

The application is a single Next.js 16 (App Router) project written in TypeScript 5, styled with Tailwind CSS 4 and shadcn/ui components, animated with Framer Motion. Data lives in Supabase Postgres behind Prisma; rate limiting and ephemeral counters use Upstash Redis over REST. Authentication is NextAuth with credentials and server-side sessions; role gates (customer / admin / driver) are enforced in middleware and in every API route that matters. The frontend reads server state through React Query hooks; Zustand remains only for genuinely ephemeral UI state and some legacy local persistence noted in section 10.

Area	Where to look	Notes
Landing page	src/components/customer/customer-landing.tsx	Hero, pricing (live server prices), guarantee, testimonials, footer
Booking wizard	src/components/customer/booking-wizard.tsx	Retail + corporate flows, guest checkout, Paystack redirect
Portal / admin / driver	src/app/portal, /admin, /driver	React Query against the API layer
API routes	src/app/api/**	orders, payments, reviews, paystack, driver/location, auth
Domain model	prisma/schema.prisma	Users, Orders, OrderItem, Payment, Review, DriverLocation, PriceCatalog, Settings
Pricing	src/lib/types.ts (GARMENT_CATALOG) + src/lib/pricing-groups.ts	Single source shared by landing + wizard; DB PriceCatalog overrides at runtime
Geofencing	src/lib/geo.ts	12 Lagos service zones; rider GPS pings; enforcement radii
Notifications	src/lib/notifications.ts	Branded email (Brevo) + SMS (Termii); env-gated, never throws
Email templates	src/lib/email.ts	BREVO_VERIFIED_SENDER_EMAIL overrides the hardcoded fallback sender

Table 5 — Codebase map: the fastest path into each subsystem.

Three design decisions are worth knowing before you change anything. First, pricing has one source of truth: the server-side PriceCatalog, seeded from GARMENT_CATALOG, is what orders are actually charged at; the landing page and wizard display those same live prices, so a settings change propagates everywhere at once. Second, guest checkout is first-class: POST /api/orders accepts a guest payload, find-or-creates the customer, and creates the bank-transfer payment record atomically with the order. Third, everything degrades gracefully — missing Paystack or Termii keys never crash a flow, they surface clean 503s or silently skip SMS.

8. Deployment Pipeline & Environment

8.1 How deploys actually work

The single most important operational fact: **pushing to GitHub does not auto-deploy**. The Vercel Git integration is not connected (the webhook expects an org/repo/sha gitSource format that this repository arrangement does not provide). Production deploys are triggered through the Vercel REST API using a personal access token, with the team and project IDs below. The reference implementation is scripts/vercel_deploy.py in the repository, which wraps the whole sequence: create deployment from a target commit SHA, poll until READY, verify. Alternatively, click Deploy in the Vercel dashboard on any past commit — that path works too.

Setting	Value
Vercel project	kozy-dryclean (prj_BUv0ZqDMzsONFBQXXCgBJfmIN43e)
Team	team_RJD4xe4C4h3TiJ3M3iEa8idV
Build command	bun run build:vercel — runs prisma db push, then next build
Effect of build command	Database schema auto-syncs on every deploy; no manual migrations needed
Domains	kozycare.ng (primary) · www → apex 308 redirect · kozy-dryclean.vercel.app (legacy)
Deploy trigger	POST /v13/deployments with teamId + gitSource SHA (see scripts/vercel_deploy.py)

Table 6 — Deployment configuration at a glance.

8.2 Environment variables

Variable	Status at handover	Purpose
DATABASE_URL	set (Vercel)	Supabase Postgres connection string

Variable	Status at handover	Purpose
NEXTAUTH_SECRET / NEXTAUTH_URL	set — URL is https://kozycare.ng	Session signing and canonical base URL
NEXT_PUBLIC_APP_URL	set — https://kozycare.ng	Client-side links, emails, Paystack callbacks
UPSTASH_REDIS_REST_URL / TOKEN	set (Vercel)	Rate limiting on public API routes
BREVO_API_KEY	set	Transactional email (auth flows, order updates)
BREVO_VERIFIED_SENDER_EMAIL	not set — falls back to a personal Gmail	Set to concierge@kozy.ng once verified in Brevo
PAYSTACK_SECRET_KEY / WEBHOOK_SECRET	not set	Activates online card payment + webhook verification
TERMII_API_KEY	not set	Activates SMS notifications

Table 7 — Environment variables. Secrets live only in Vercel settings, never in the repo.

Local development is standard: clone, bun install, copy `.env.example` to `.env`, fill the values from Vercel (Settings → Environment Variables), and run `bun run dev`. Prisma talks to the same Supabase database, so treat local writes as production writes — create test data sparingly and clean it up. The `scripts/` directory also contains `create-admin.ts` for seeding an admin account and a handful of maintenance utilities worth reading before running.

9. Key Subsystems

9.1 Reviews

Reviews are database-backed end to end. Customers reach the review form from the Rate button on delivered orders (portal) or a review link; the form fetches order context from `/api/reviews/order-context`, which accepts only full order CUIDs (order numbers are rejected, preventing review hijacking), is IP rate-limited, and returns only the minimum fields needed. Public testimonials come from `/api/reviews`, which returns approved DB reviews, padded up to a minimum of six by marketing seed testimonials in `src/lib/starter-testimonials.ts` so the carousel never looks empty on day one. Moderation (approve / hide) happens in the admin console via `/api/reviews/admin` with role checks.

9.2 Guest checkout & payments

The booking wizard accepts guests (no account) with inline validation; if the email already belongs to a password-holding account, the API returns 409 and the UI offers sign-in. Bank-transfer payments are created atomically with the order and land in the admin verification queue. Card payment goes through `POST /api/paystack/initialize` — ownership-checked, creating a PENDING payment whose reference equals the order number, matching the webhook convention — then redirects to the Paystack hosted page;

/payment/callback polls GET /api/paystack/verify and renders a branded result. The charge.success webhook marks the payment paid and fires notifications.

9.3 Rider geofencing

Riders GPS-ping /api/driver/location roughly once a minute while on shift. The server checks the ping against twelve Lagos service zones (src/lib/geo.ts): outside all zones, order activity pauses for that rider; inside, only stops within 12 km are offered and confirmations beyond 15 km from the stop's zone are rejected server-side. Stale or missing pings fall back to legacy behaviour, so the system never bricks the driver app. Zone radii are plain data — tuning them as the business grows is a one-file change.

9.4 Notifications

src/lib/notifications.ts sends branded HTML email through Brevo and SMS through Termii on order creation, guest account creation, status changes, and verified payments. Every send is wrapped so a failure never breaks the flow that triggered it. SMS is gated to actionable statuses (picked up, out for delivery, delivered) to respect the Termii balance. Until the keys are set, both channels stay dormant by design.

10. Known Limitations & Technical Debt

Nothing on this list is broken for customers; these are the honest edges a successor should know about, roughly ordered by how soon they will bite.

Item	Impact	Suggested fix
Zustand still mirrors users/orders/payments into localStorage	Legacy demo architecture; can confuse debugging and show stale data after role switches	Finish the migration: React Query reads, Zustand for ephemeral UI only
Admin notifications panel is localStorage-only	Notifications do not survive device changes	Back with a DB table + polling or server events
GitHub → Vercel auto-deploy is not wired	Every deploy needs an API call or dashboard click	Fix the webhook gitSource format, or add a GitHub Action calling the Vercel deploy API
Brand sheet documents the previous logo generation (v1.1)	Printed guidelines lag the v4 K mark now used on the site	Regenerate from scripts/kozy-brand/build_brand_sheet.py with the v4 lockup
One test order (KZ-02150959) + guest test account in production data	Pollutes reporting slightly	Cancel the order in admin; delete the guest account
Vercel Web Analytics not yet enabled	No traffic data collected yet	One click: project → Analytics → Enable

Item	Impact	Suggested fix
Pricing seeds live in code + DB	A price change is trivial, but new items need a code edit	Move the full catalogue to the PriceCatalog table and manage purely from settings

Table 8 — Known limitations, their impact, and the recommended fix.

11. Suggested Roadmap & Asset Map

If you take the platform forward in this order, each step builds on the last and none is wasted work:

- **Activate payments and SMS** (keys only) — the single highest-ROI step; both systems are complete and tested.
- **Enable analytics** and let two weeks of data accumulate before changing the funnel.
- **WhatsApp integration** — wa.me deep links on the landing page and in status notifications; Lagos customers live on WhatsApp.
- **Fix the deploy pipeline** — a GitHub Action calling the Vercel API on push, so future developers cannot forget the manual step.
- **Admin notifications to the database**, then retire the remaining Zustand localStorage persistence.
- **Brand sheet v4 refresh** and any print re-runs as prices evolve — the generator scripts make both cheap.

11.1 Where everything lives

What	Where
Application source	github.com/R2deetwo/Kozy-Dryclean (main branch is production)
Deploy / env reference script	scripts/vercel_deploy.py in the repository
Marketing kit (print + digital + sources)	kozy-brand/ folder delivered with this handover
Marketing generator scripts	scripts/kozy-brand/ — build_v42.py, build_cards.py, render + package scripts
Session worklog (full history)	worklog.md in the repository root
This document	Kozy-Care-Project-Handover.pdf, delivered alongside the kit

Table 9 — Asset map: where to find everything referenced in this document.

A final note on the worklog: worklog.md in the repository is the unedited, chronological record of every phase of this project — what was built, what was verified, what was deferred, and why. When this document and the worklog disagree, the worklog is the more detailed witness; when you need the reasoning behind any decision, it is almost certainly recorded there. Good luck — the platform is in good shape, and it is entirely

yours.
